COMMENTS

- NO VIDEO submitted
- NO GIT Sub Branches
- NO responsiveness

- Line of code:

```
const buttonSubmit = document.getElementById('formButton')
```

is invalid as no button with such id exists but with class "formButton" exists, thus code should be:

```
const buttonSubmit = document.querySelector('.formButton')
```

OR

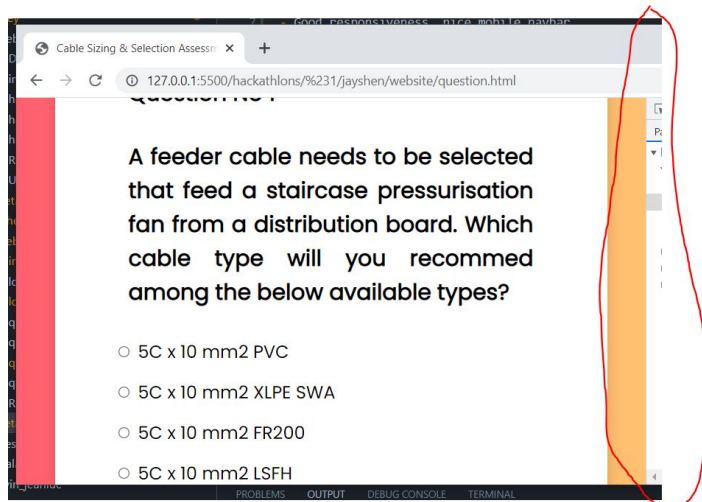

```
const buttonSubmit = document.getElementsByClassName('formButton')
```

- When login is done the page is redirected to "test.html", this page doesn't exist

```
buttonSubmit.addEventListener('click', () => {  
  window.location.assign("test.html")  
});
```

My guess, it should have been redirected to "question.html"

- No vertical scroll bar appear on small screens

- Nice javascript code. Good use of functions, and very nice binding of array "quizData" to DOM elements.
- Eventhough no loop present, very nice use of setInterval, which counts as a "loop mechanism"

```
button.addEventListener('click', () => {  
  let interval = setInterval(() => {  
    if (mins == 0) {  
      timer.innerText = mins;  
      clearInterval(interval);  
      return;  
    }  
    timer.innerText = mins + ' Minutes Remaining';  
    mins--;  
  }, 60000);  
});
```

- Good job, unfortunately does not satisfy requirements of the hackathon, but very nice start.
