COMMENTS

- GIT Sub Branches PRESENT 👍

- Responsive. Good use of bootstrap grid (rows & cols) 👍
- Impressive calculator 👍
- Nice color transition on the background good use of setInterval 👍

```
//function to call the background div and set the color
const setRandomBackground = () => {
  let div = document.querySelector("body");
  let color = getRandomColor();
  div.style.transition = "background-color 2s ease-in-out";
  div.style.backgroundColor = color;
}
//initialize background color change function
setInterval(setRandomBackground, 3000);
```

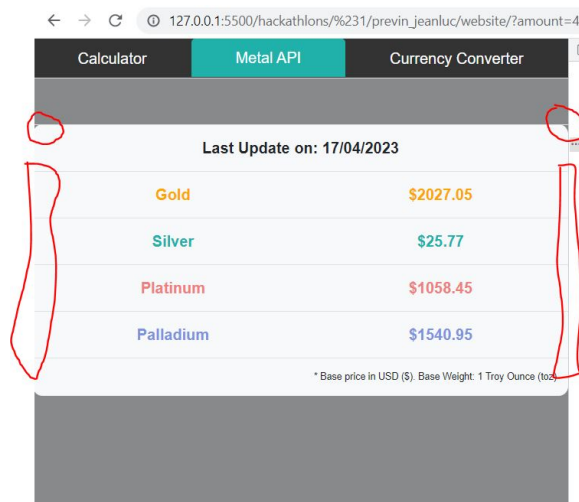

- Good use of the fetch function 👍

```
/* Metals Api */
const getMetalPromise = () => {
  const url = 'https://api.metals.live/v1/spot';
  const corsUrl = 'https://corsproxy.io'; // have to make use of a proxy
```

because of cors issues

```
return fetch(url)
  //fetch(corsUrl + '?' + url)
  .then(response => response.json())
  .then(data => {
    // Return the data
    return data;
  })
  .catch(error => {
    // Handle any errors
    console.error(error);
  });
}
```

- Some padding on the left and right would've been nice on small width screens + there is some "left over" border on top of the Metal table/list 👎

- On the Converter tab, your aren't using the onsubmit event of the form element, even though you have a form element

```
<form>
  <div class="form-group">
    <label for="amount">Enter amount in MAURITIAN RUPEE (MUR):</label>
    <input type="number" class="form-control" id="amount" name="amount">
  </div>
  <div class="form-group">
    <label for="currency">Select currency to convert to:</label>
    <select class="form-control" id="currency" name="currency">
      <option value="AUD">Australian Dollar (AUD)</option>
      <option value="USD">U.S Dollar (USD)</option>
      <option value="CAD">Canadian Dollar (CAD)</option>
      <option value="EUR">Euro (EUR)</option>
      <option value="GBP">British Pound (GBP)</option>
      <option value="JPY">Japanese Yen (JPY)</option>
    </select>
  </div>
```

```
<button type="button" class="btn btn-primary btn-style"
onclick="convertCurrency()">Convert</button>
</form>
```

Which means that when the focus is on the "Enter Amount" input and the user presses the "Enter" button, the default form submit is triggered and the page is refreshed. 🙄

- Good use of functions and loops 👍
- Overall very nice project. Great implementation of API calls and binding data to DOM elements. Well done! 👍
